# 3000788 Intro to Comp Molec Biol

## Lecture 23: Introduction to machine learning and AI

Fall 2025

**Sira Sriswasdi, PhD**

- Research Affairs
- Center of Excellence in Computational Molecular Biology (CMB)
- Center for Artificial Intelligence in Medicine (CU-AIM)

# Today's agenda

---

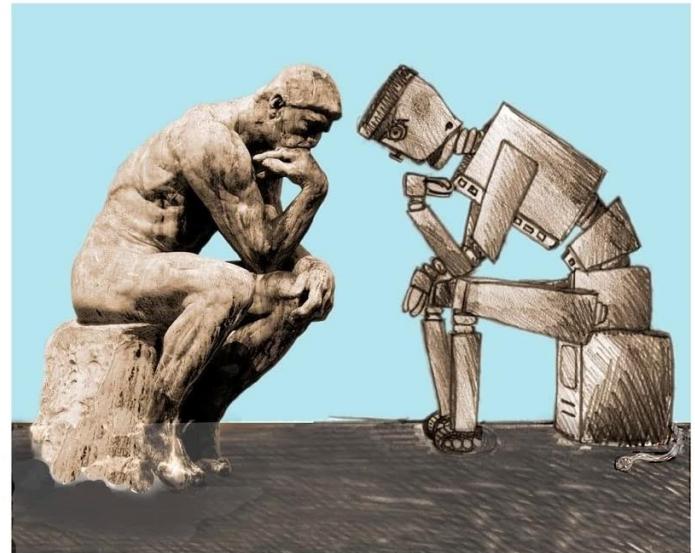

- What is machine learning and AI
- Evolution of AI: from rule-based to generative model

# Natural vs artificial intelligence

---

- AI is a result of computer algorithms mimicking the natural learning process
- Signs of intelligence
  - Memorization
  - Pattern recognition and generalization
  - Learning from trials and errors
  - Ability to create
  - Reasoning with cause and effect

NATURAL AND ARTIFICIAL  
INTELLIGENCE

ROBERT K. LINDSAY

# Memorization and information compression

---

# Pattern recognition

---

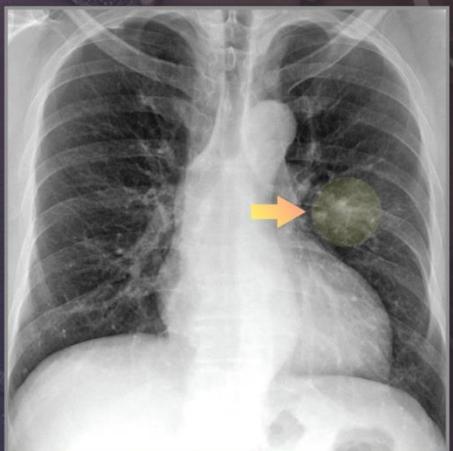

## Human vs Machine: Pneumonia

Chest X-Rays image the lungs, heart, blood vessels, and bones. AI has been used to read and understand them.

Example:  
**Pneumonia**

Computers:  
**Score: 0.371**

Doctors:  
**0/15 Detected**

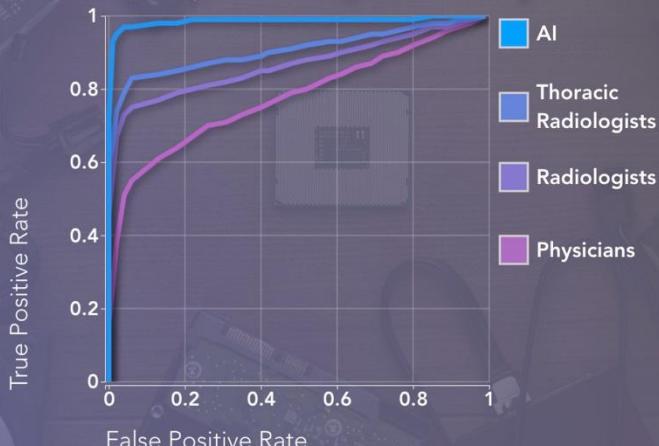

Clearvue Health

Hwang et al

## AI vs Doctors: Chest X-Rays

AI was significantly more accurate and precise than radiologists and physicians in diagnosing chest x-rays.

### AUC-ROC: Human vs Computer

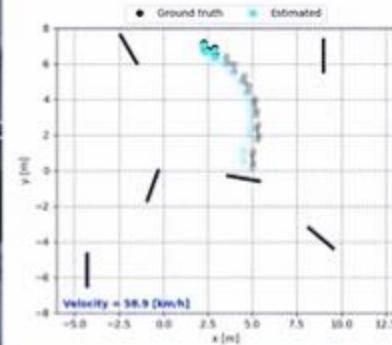

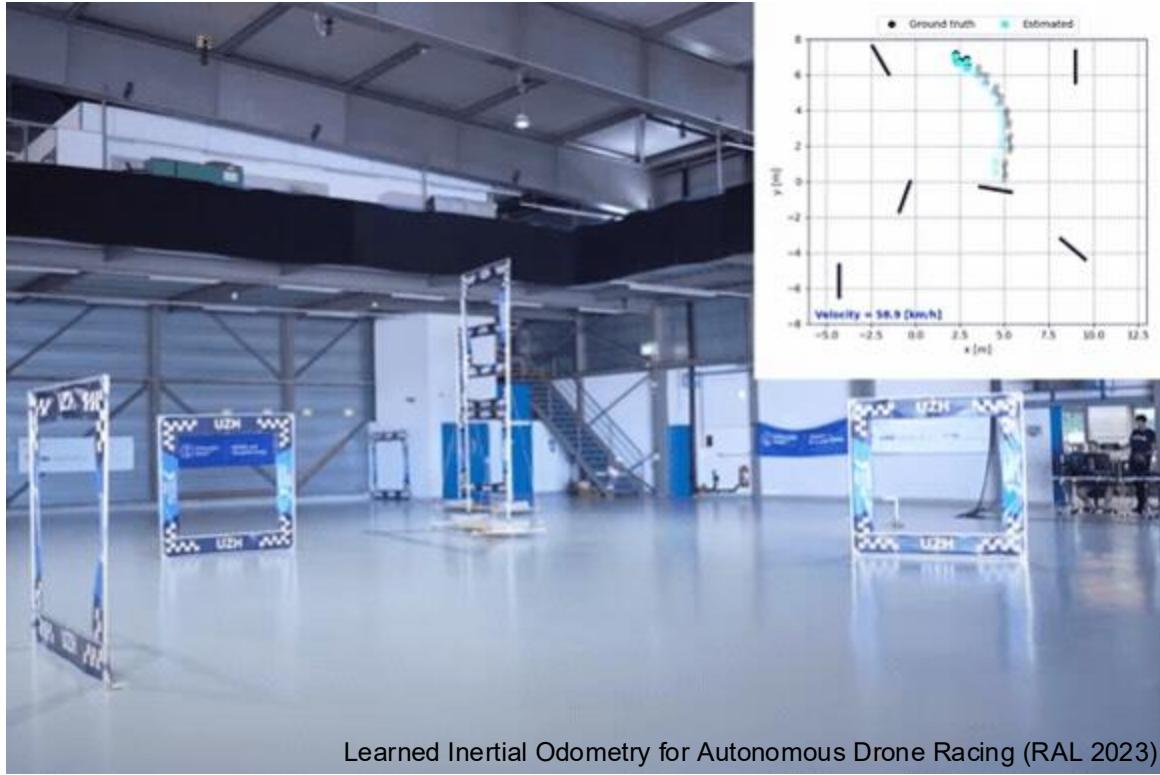

Clearvue Health

Hwang et al

# Trial and error

---

Google DeepMind's AlphaGo computer beats top player Lee Sedol for third time to sweep competition

# **Machine learning (ML)**

The engine behind modern AI

# AI 1.0: Hand-crafted algorithms

---

[https://www.cloudaccess.net/fresh/blog/entry/2018/12/07/wait-what-google-isn't-the-only-search-engine-on-the-web.html](https://www.cloudaccess.net/fresh/blog/entry/2018/12/07/wait-what-google-isn-t-the-only-search-engine-on-the-web.html)

<https://shapeshed.com/photoshop-101-the-magic-wand-tool/>

# Making computer optimizes itself

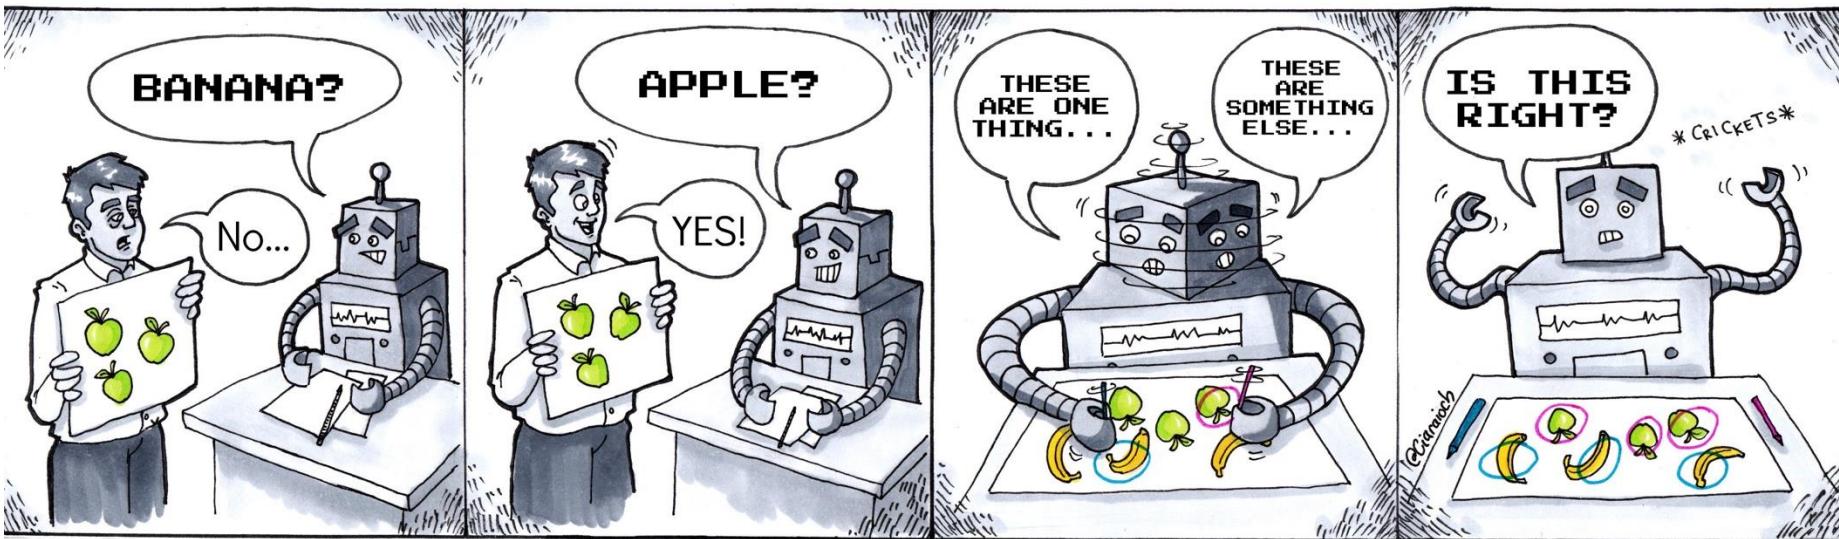

---

Source: Cortes and Sanchez. IEEE Latin America Transaction (2021)

- The relationship is too complex for human to define
- Instead, human provides the data ( $x, y$ ) and let the computer do the fitting

# Machine learning paradigms

## Supervised Learning

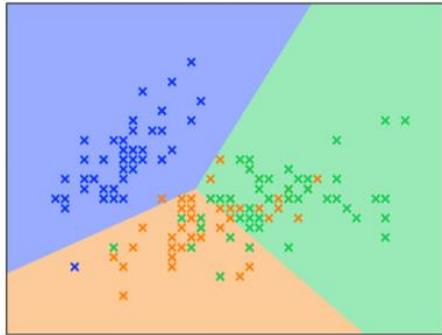

Find accurate decision functions

## Unsupervised Learning

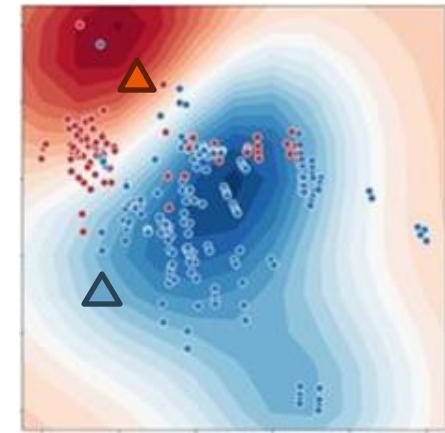

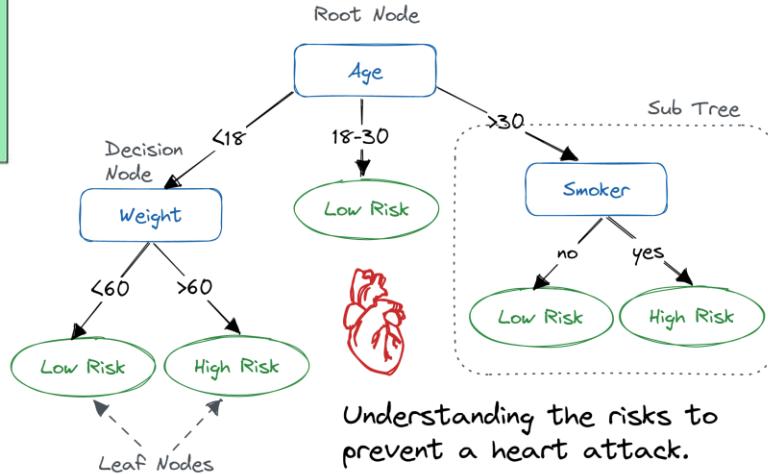

Find similarities among data

# AI 2.0: Classical ML models

Linear: Weighted score =  $(\text{input}_1 \times w_1) + \dots + (\text{input}_n \times w_n)$

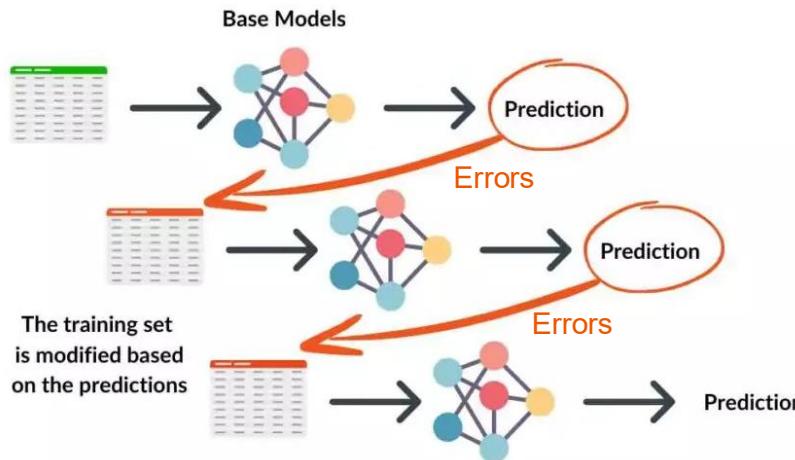

**Tree:** Collection of decisions

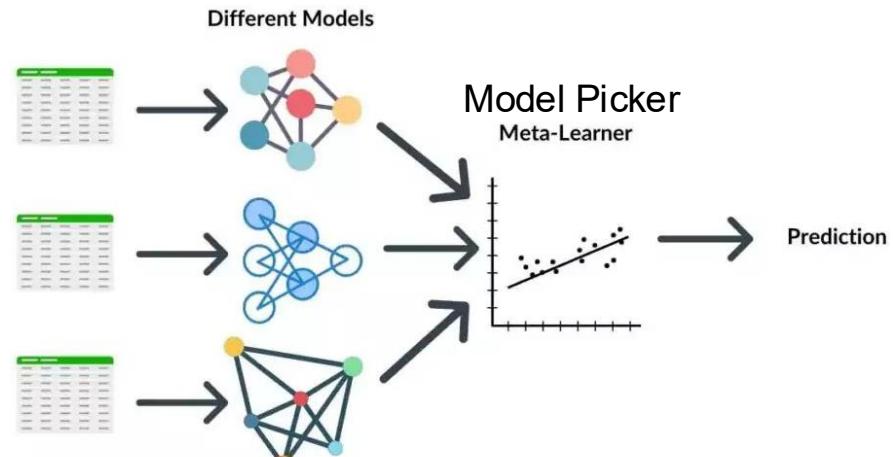

**Nearest neighbors:**  
Predict using similarity  
to past observations

# Enhancement with ensemble approaches

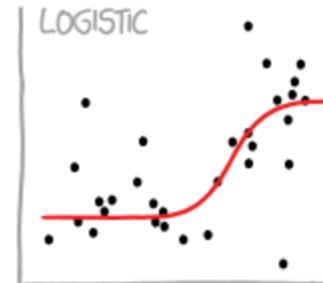

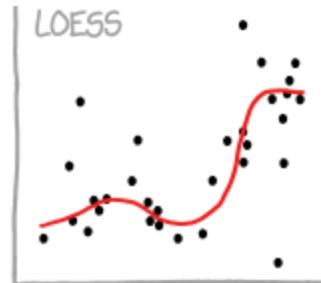

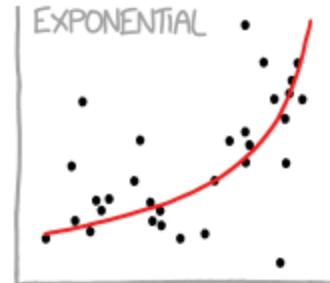

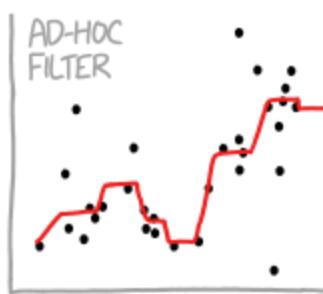

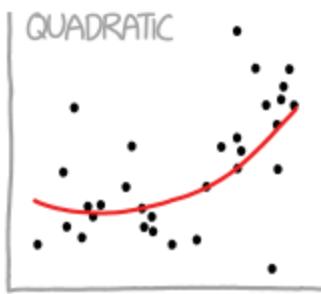

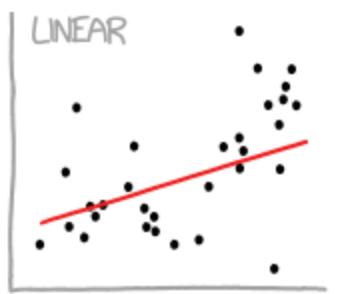

**Boosting:** Iterative improvement with additional models

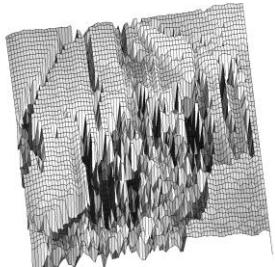

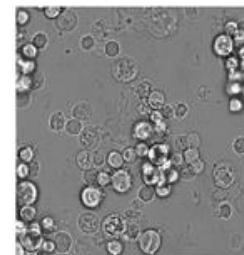

**Stacking:** Combine multiple models with different capabilities

# Limitation of classical ML

- Unable to fit complex relationships
- Unable to handle raw data like text or image

# Representation learning

Training computer to parse complex data

# Naïve data representation is not useful for prediction

	1	2	3	4	5	6	7	8	9
man	1	0	0	0	man		= 1		
woman	0	1	0	0	woman		= 2		
boy	0	0	1	0	boy		= 3		
girl	0	0	0	1	girl		= 4		
prince	0	0	0	0	1	0	0	0	0
princess	0	0	0	0	0	1	0	0	0
queen	0	0	0	0	0	0	1	0	0
king	0	0	0	0	0	0	0	1	0
monarch	0	0	0	0	0	0	0	0	1

# What is a (good) representation of the data?

---

- Numerical mapping of the raw data that are informative of the **key characteristics**
- **Key characteristics** have different meaning based on your purpose for the data
  - Classification / regression
  - Reconstruction
  - Dimensionality reduction

Chung, S. et al. "Classification and Geometry of General Perceptual Manifolds"

# Information extraction from image with kernels

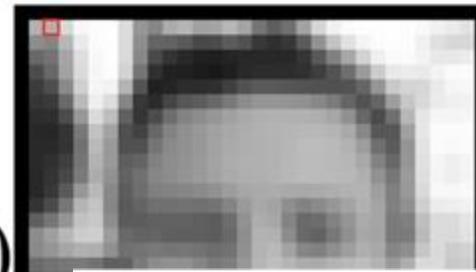

input image

Kernel

$$\begin{pmatrix} 205 & + & 247 & + & 245 \\ \times 0.0625 & \times 0.125 & \times 0.0625 \\ + 161 & + & 137 & + & 244 \\ \times 0.125 & \times 0.25 & \times 0.125 \\ + 154 & + & 75 & + & 200 \\ \times 0.0625 & \times 0.125 & \times 0.0625 \end{pmatrix} = 175$$

kernel:  
blur

Kernel

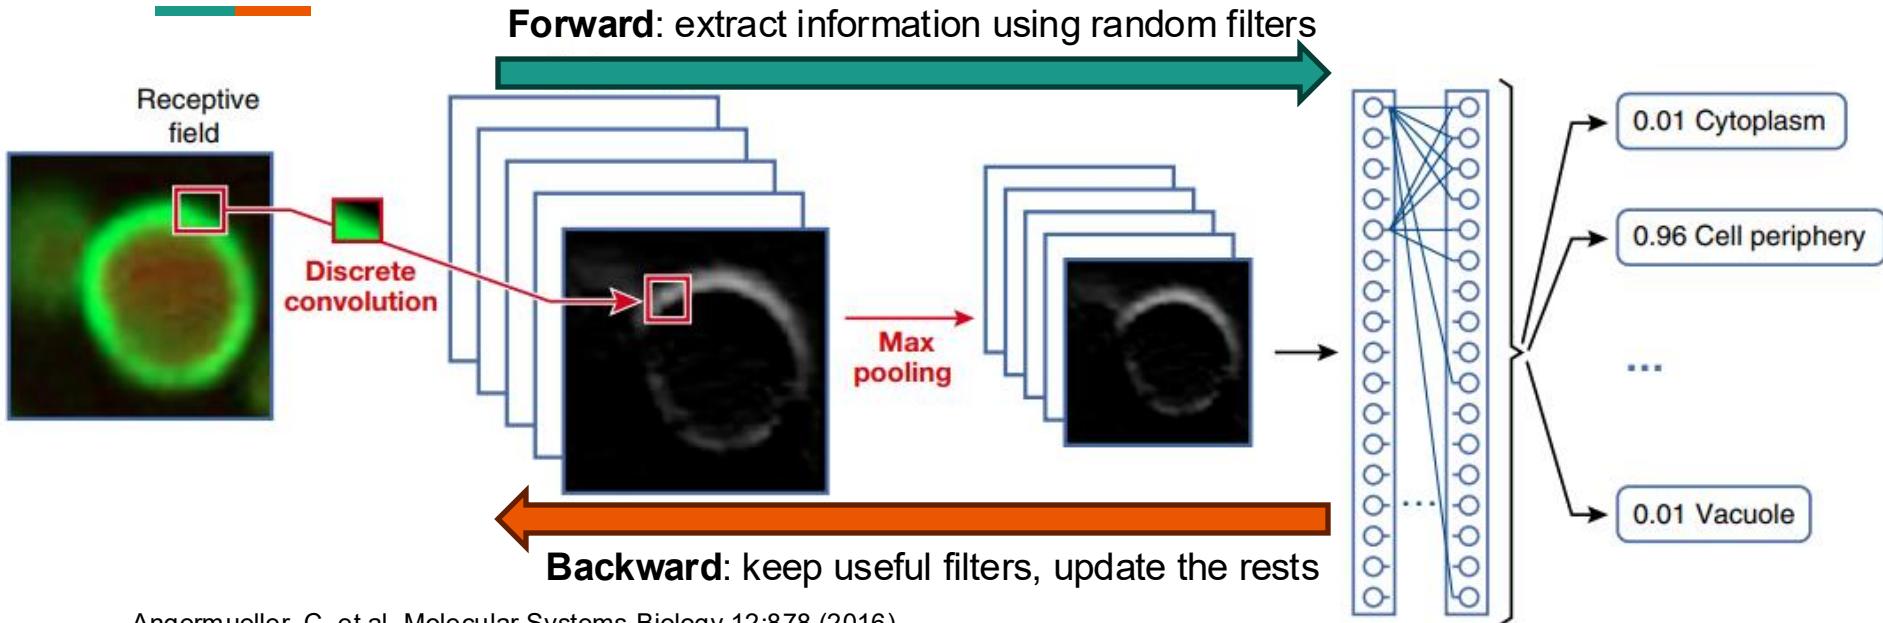

$$\begin{pmatrix} 205 & + & 247 & + & 245 \\ \times -1 & \times -1 & \times -1 \\ + 161 & + & 137 & + & 244 \\ \times -1 & \times 8 & \times -1 \\ + 154 & + & 75 & + & 200 \\ \times -1 & \times -1 & \times -1 \end{pmatrix} = -435$$

kernel:  
outline

output image

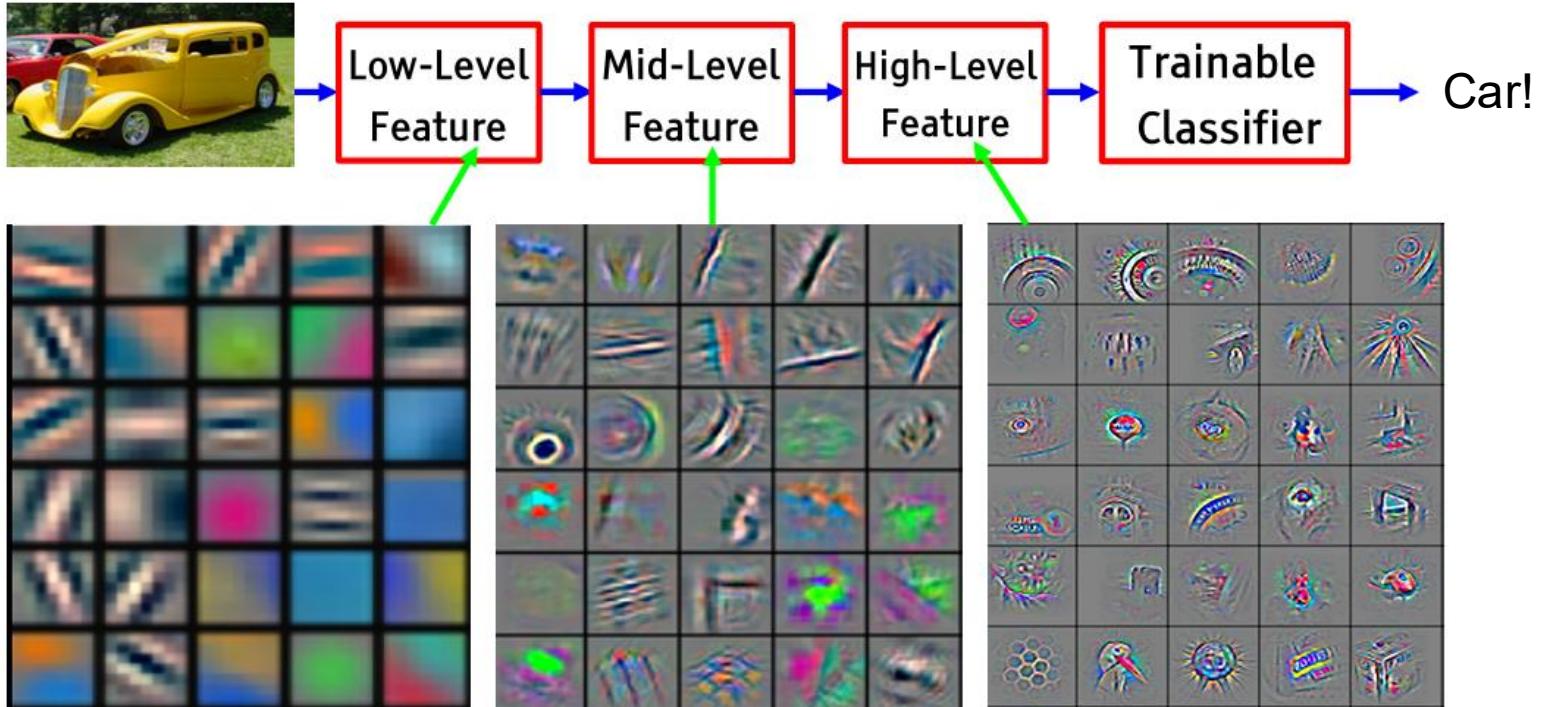

# AI 3.0: Data-driven representation learning

Angermueller, C. et al. Molecular Systems Biology 12:878 (2016)

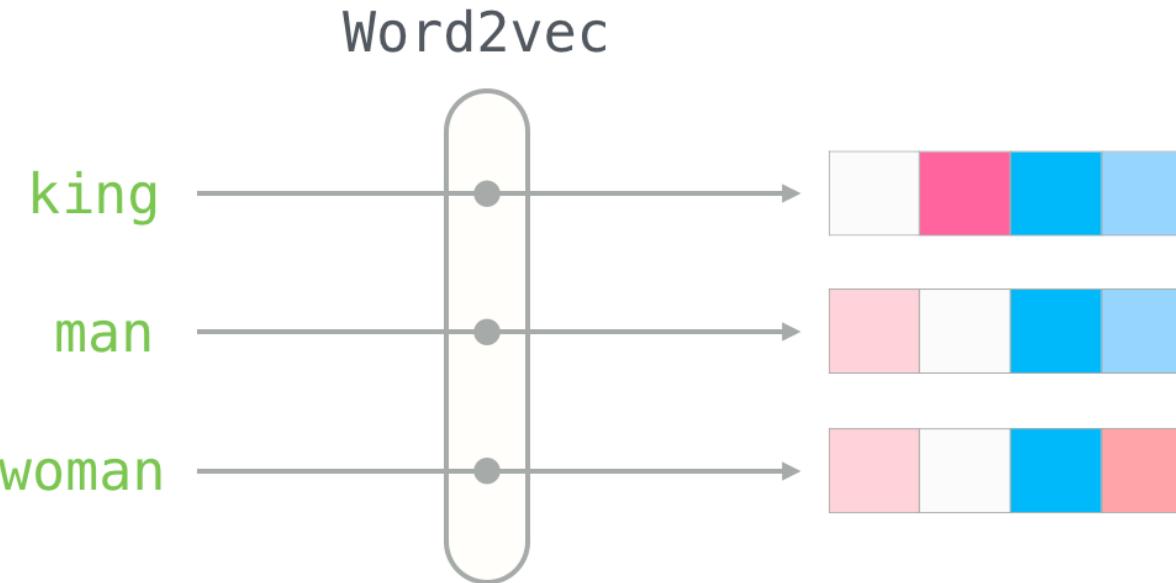

- Finding the right kernels is too difficult for human
- Instead, human provides the data ( $x, y$ ) and let the computer do the fitting

# Convolution kernels create image representation

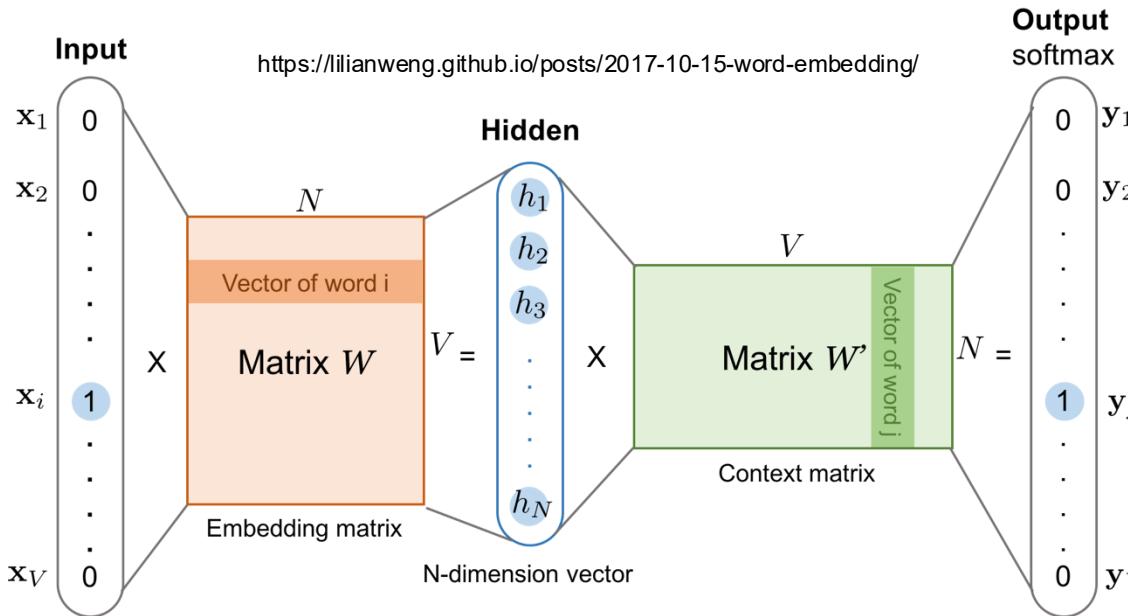

# Word embedding

---

- Transformation of a word into a useful vector that captures its meaning and other characteristics. But how?

# How to learn a good word embedding?

- Map each word to an  $n$ -dimensional vector (representation)
- Use these representations to make prediction, but what to predict?

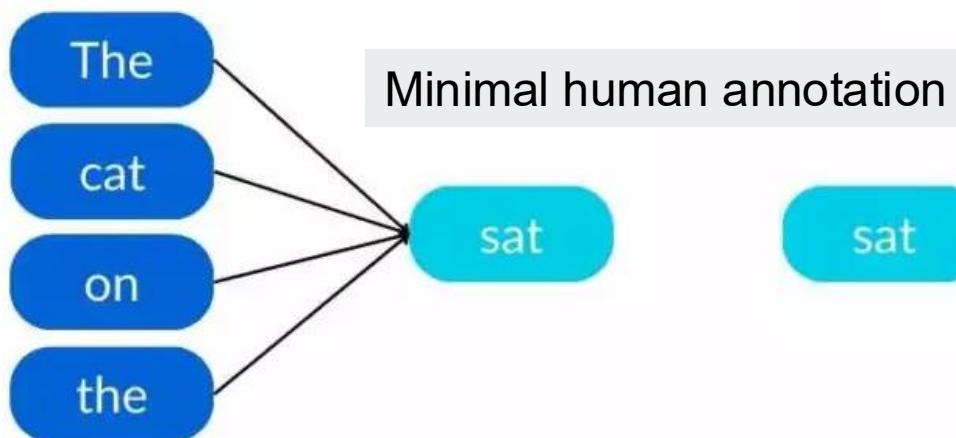

# Predict the central word or surrounding words

---

Example Sentence: The cat sat on the mat.

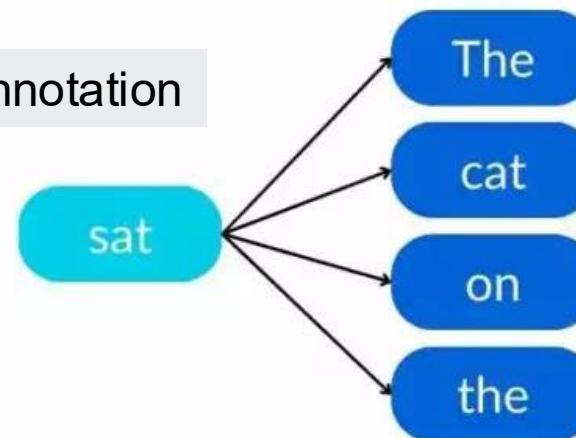

## Continuous Bag-of-Words (CBOW)

Goal: Given context words,  
predict the target word.

## Skip-gram Model

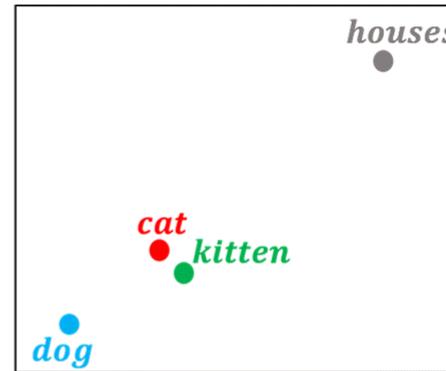

Goal: Given a word,  
predict the surrounding context words.

# Meaningful word embedding

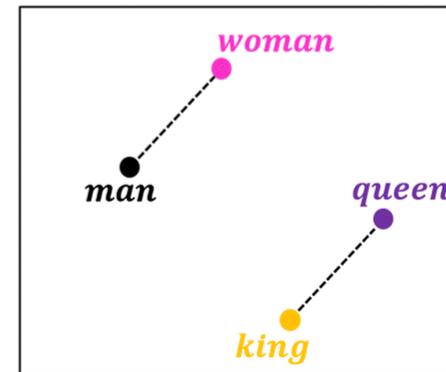

<i>cat</i> →	0.6	0.9	0.1	0.4	-0.7	-0.3	-0.2
<i>kitten</i> →	0.5	0.8	-0.1	0.2	-0.6	-0.5	-0.1
<i>dog</i> →	0.7	-0.1	0.4	0.3	-0.4	-0.1	-0.3
<i>houses</i> →	-0.8	-0.4	-0.5	0.1	-0.9	0.3	0.8

Dimensionality reduction of word embeddings from 7D to 2D

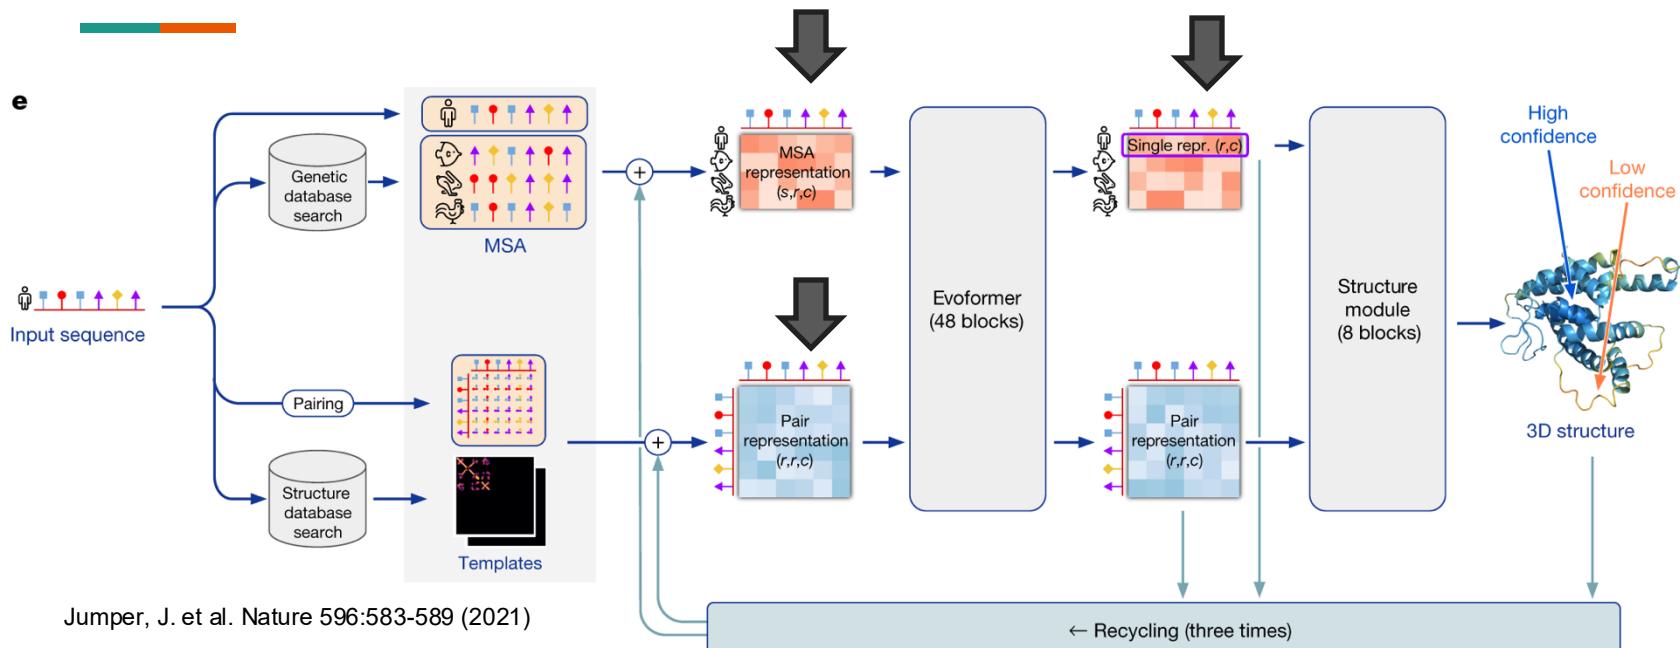

<i>man</i> →	0.6	-0.2	0.8	0.9	-0.1	-0.9	-0.7
<i>woman</i> →	0.7	0.3	0.9	-0.7	0.1	-0.5	-0.4
<i>king</i> →	0.5	-0.4	0.7	0.8	0.9	-0.7	-0.6
<i>queen</i> →	0.8	-0.1	0.8	-0.9	0.8	-0.5	-0.9

Dimensionality reduction of word embeddings from 7D to 2D

# AlphaFold v2 architecture

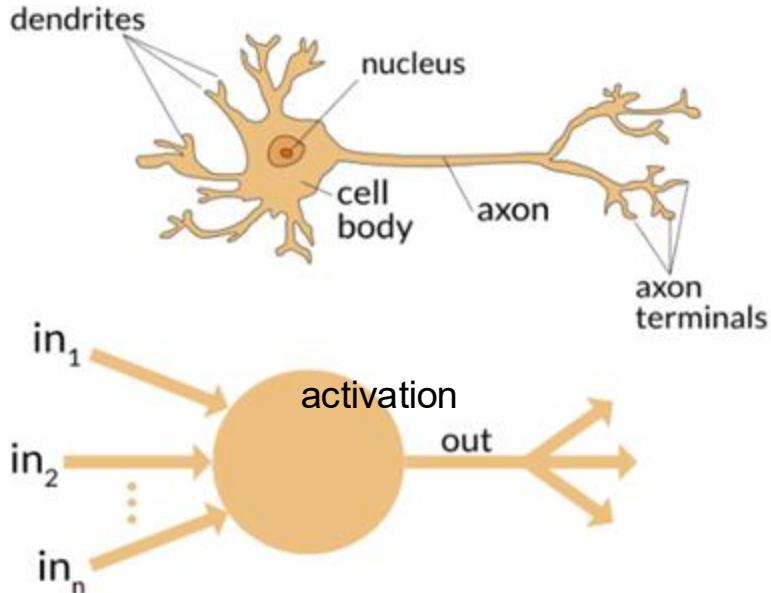

- Multiple representations of different biological concepts are trained to be computationally compatible inside the model

# The rise of artificial neural network

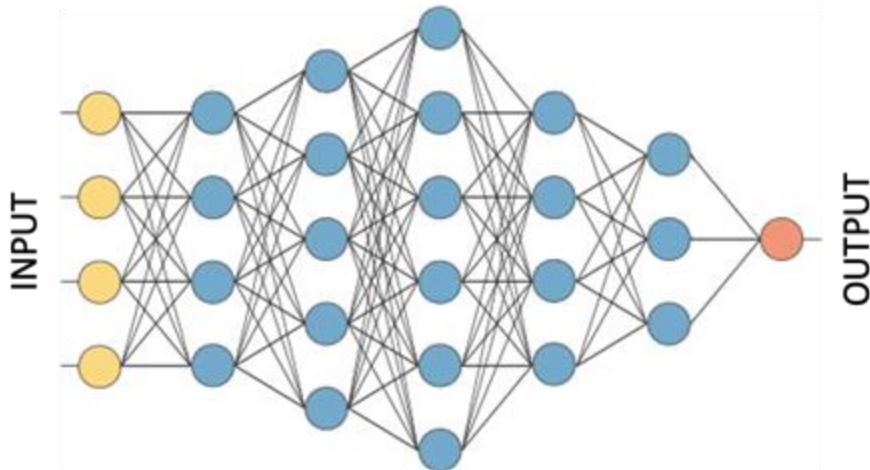

## An 80-year journey

# Inspired by biology

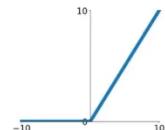

$out = f(w_1 in_1 + w_2 in_2 + \dots + w_n in_n)$   
 $f(\cdot)$  is an activation function

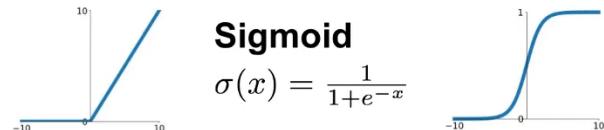

Artificial Neural Network

**ReLU**  
 $\max(0, x)$

**Sigmoid**  
 $\sigma(x) = \frac{1}{1+e^{-x}}$

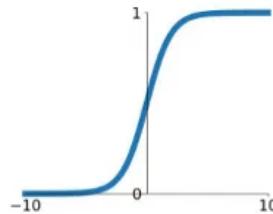

# Activation function

---

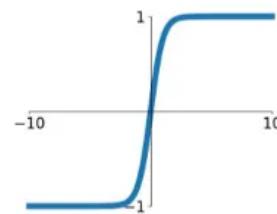

## Sigmoid

$$\sigma(x) = \frac{1}{1+e^{-x}}$$

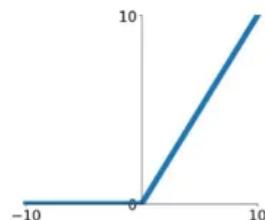

## tanh

$$\tanh(x)$$

## ReLU

$$\max(0, x)$$

- Simple, non-linear function
- Mimic the activation of a biological neuron
- Without non-linear activation function, ANN is just a linear regression

# Universal approximation theorem (Cybenko 1989)

---

**Universal Approximation Theorem:** Fix a continuous function  $\sigma : \mathbb{R} \rightarrow \mathbb{R}$  (activation function) and positive integers  $d, D$ . The function  $\sigma$  is not a polynomial if and only if, for every **continuous** function  $f : \mathbb{R}^d \rightarrow \mathbb{R}^D$  (target function), every **compact** subset  $K$  of  $\mathbb{R}^d$ , and every  $\epsilon > 0$  there exists a continuous function  $f_\epsilon : \mathbb{R}^d \rightarrow \mathbb{R}^D$  (the layer output) with representation

$$f_\epsilon = W_2 \circ \sigma \circ W_1,$$

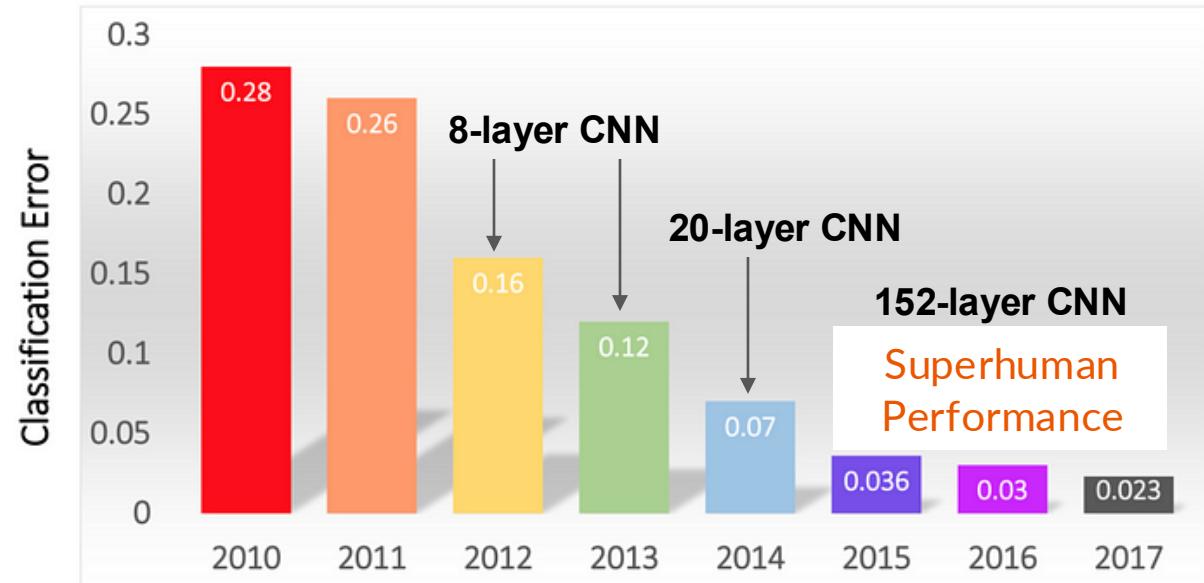

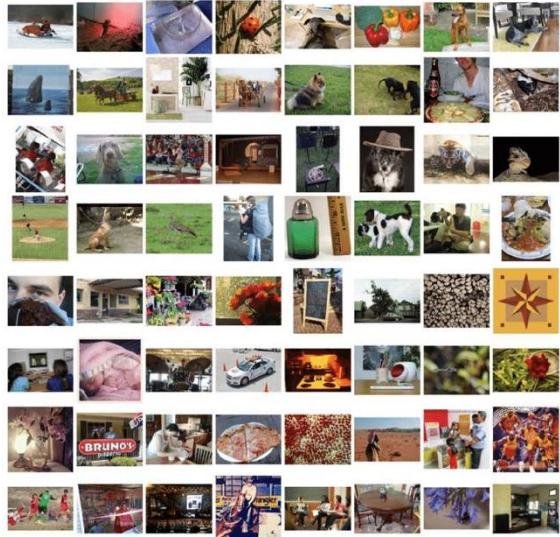

where  $W_2, W_1$  are **composable affine maps** and  $\circ$  denotes component-wise composition, such that the approximation bound

$$\sup_{x \in K} \|f(x) - f_\epsilon(x)\| < \epsilon$$

holds for any  $\epsilon$  arbitrarily small (distance from  $f$  to  $f_\epsilon$  can be infinitely small).

- ANN with just one layer of neurons and a non-polynomial activation function **can capture any continuous mathematical relationship**

# ImageNet: a showcase of ANN on real-world data

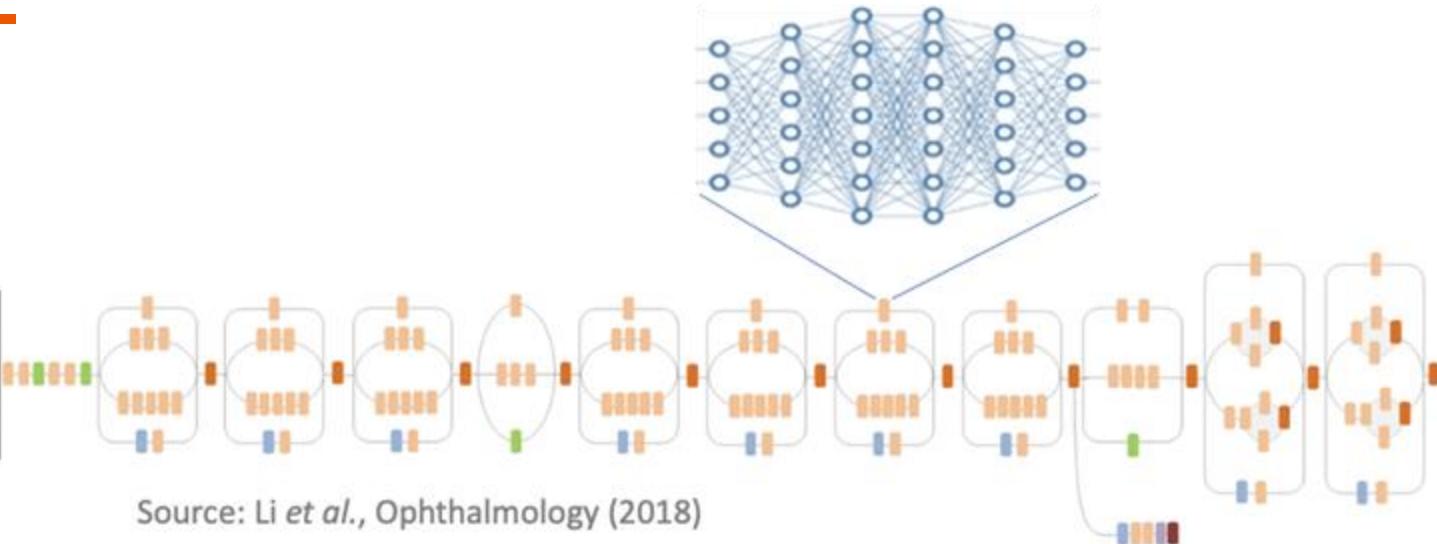

- Emergence of neural network capability due to **data** (internet and digital technology) and **computing resources** (GPU)

# Deep learning is ML for deep neural network

---

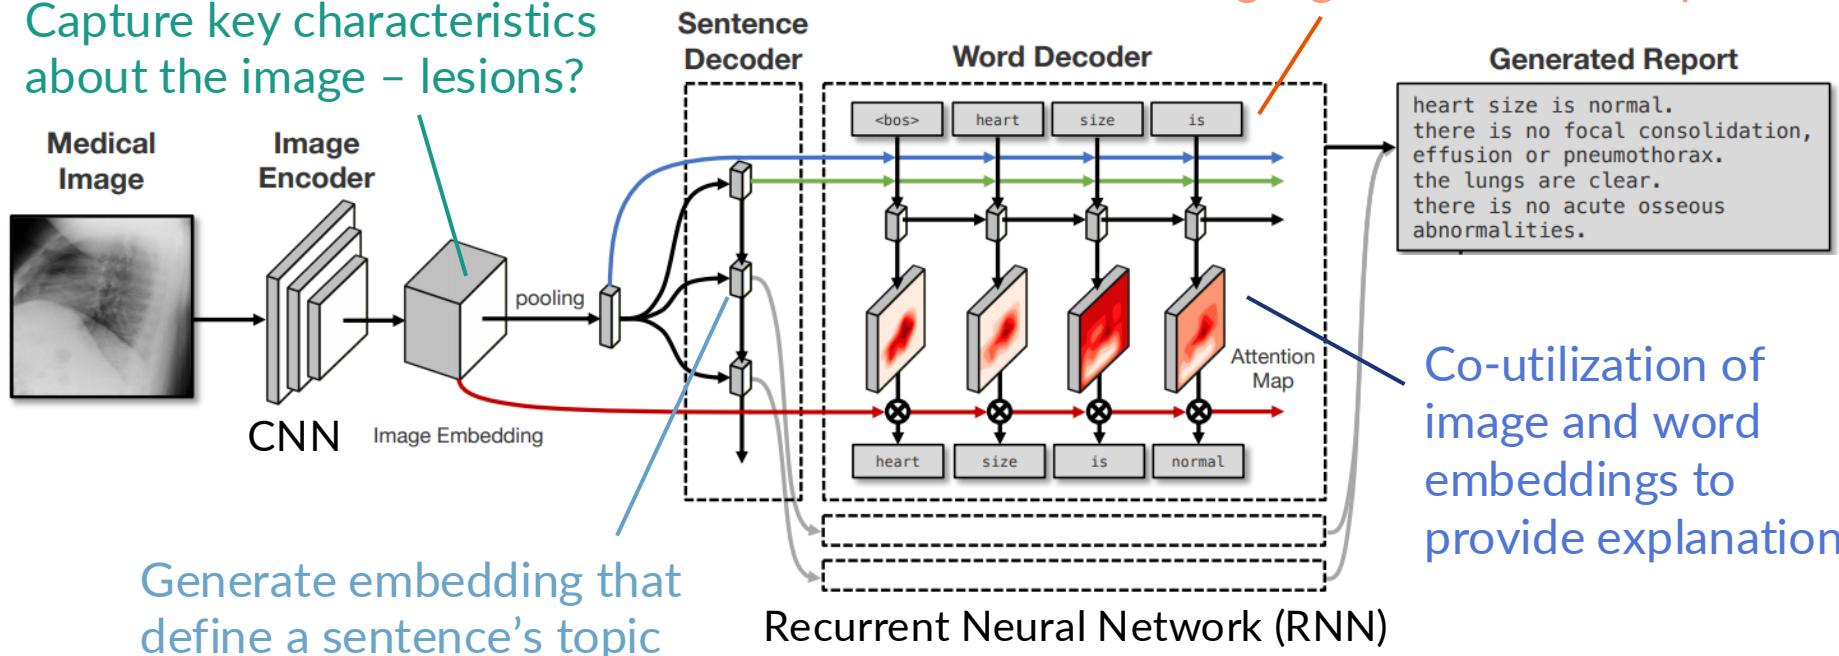

Legend:  
Convolution  
AvgPool  
MaxPool  
Concat  
Dropout  
Fully Connected  
Softmax

- Explosion in dataset and model sizes
- Techniques for guiding the model to learn embedding

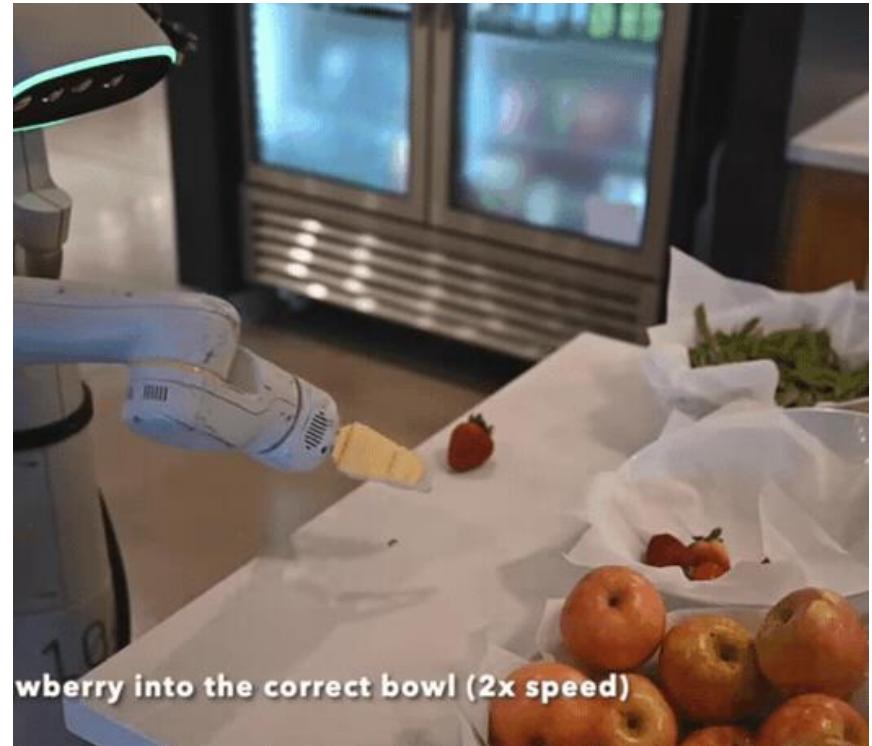

# AI 3.0 learns and utilizes embedding

Capture key characteristics about the image – lesions?

# Linking visual and text embeddings with robot control

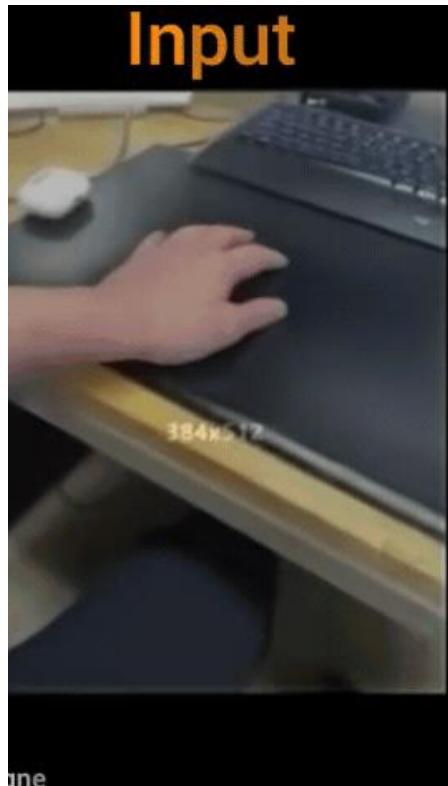

---

# AI 4.0: Generative and foundational models

# Going beyond prediction

Talking head anime: <https://github.com/pkhungum>

Stable Diffusion: 8

# The rise of large language model

---

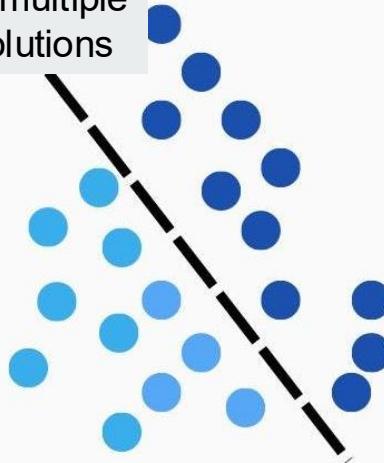

Upon examination of the chest X-ray image:

- The lungs are predominantly clear without any obvious consolidations, masses, or pneumothoraces.
- The cardiac silhouette appears within normal size limits.
- The bony thorax, including the ribs and clavicles, appears intact without any visible fractures.
- The diaphragm and costophrenic angles are well visualized and appear normal.
- There is no visible mediastinal widening or significant lymphadenopathy.

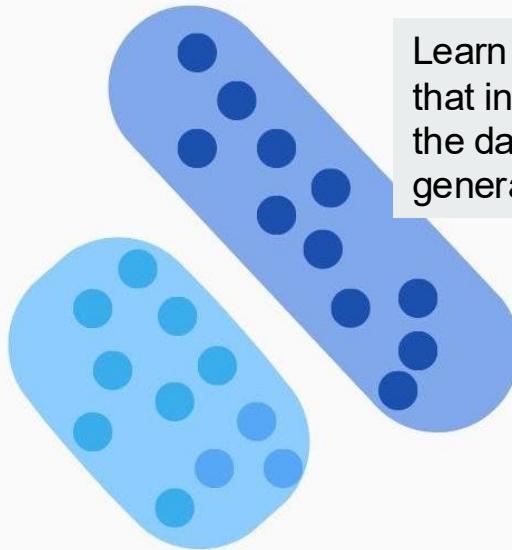

# Importance of generative approach

Simple, multiple equal solutions

Discriminative

Learn factors  
that influence  
the data during  
generation

Generative

10

vs

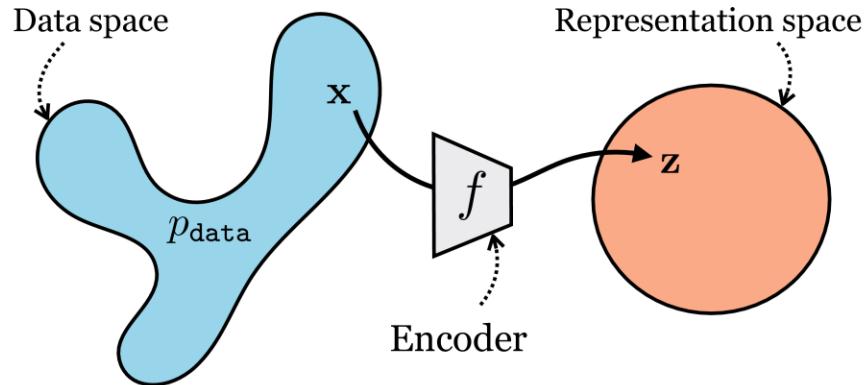

<https://www.turing.com/kb/generative-models-vs-discriminative-models-for-deep-learning>

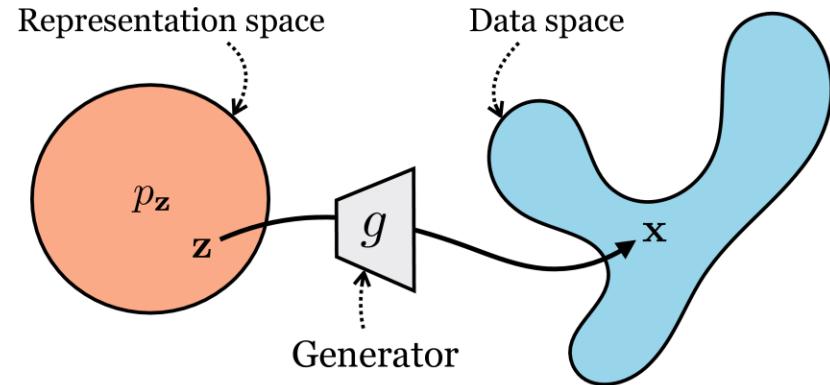

- It takes much more understanding to generate **realistic** data

# Reversed representation learning

Representation learning

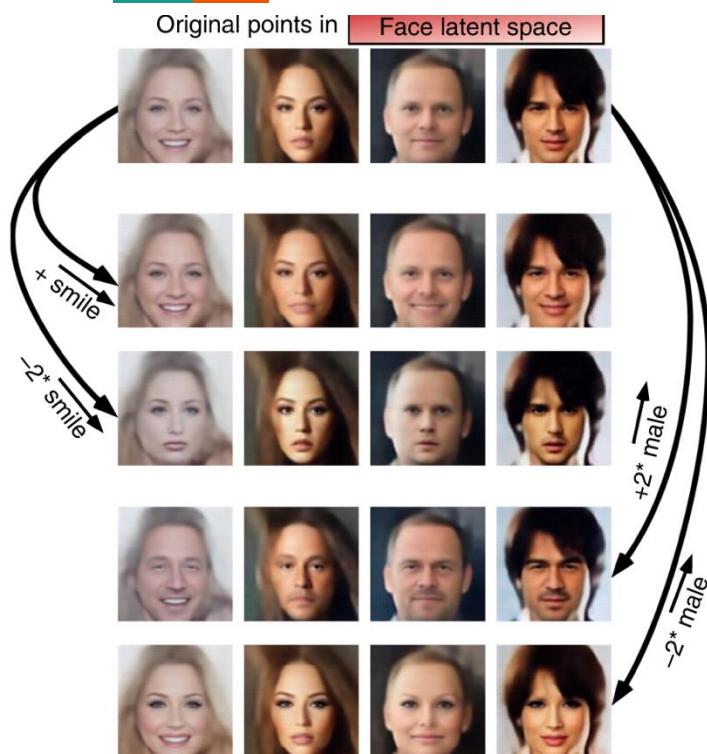

Generative modeling

[https://visionbook.mit.edu/generative\\_modeling\\_and\\_rep\\_learning.html](https://visionbook.mit.edu/generative_modeling_and_rep_learning.html)

- Generative model can be thought of as reversed representation learning
  - Compress vs decompress
- How do we train, or “guide”, the generative process?

# Interpretable generative process

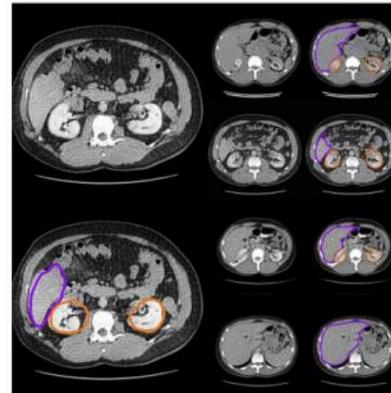

- **Assumption:** Generative model helps us understand the underlying mechanisms and the factors that generated the data
- Disentangle factors from observation
- Counterfactual “what-if” analysis

# RadImageGAN

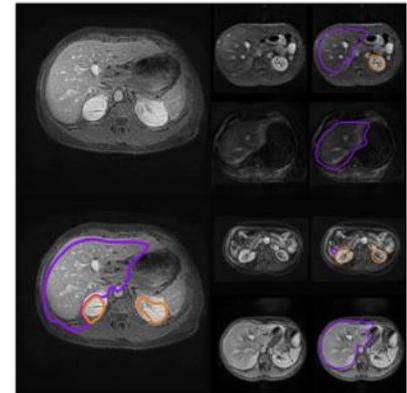

---

- StyleGAN on radiological images from 100,000 patients
- 12 anatomical regions and 130 pathological classes
- Can generate both images and labeled masks to train future AI models

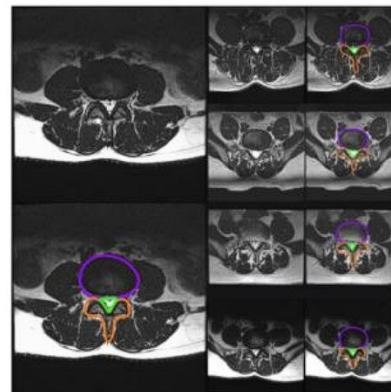

A) CT Abdomen

B) MRI Abdomen

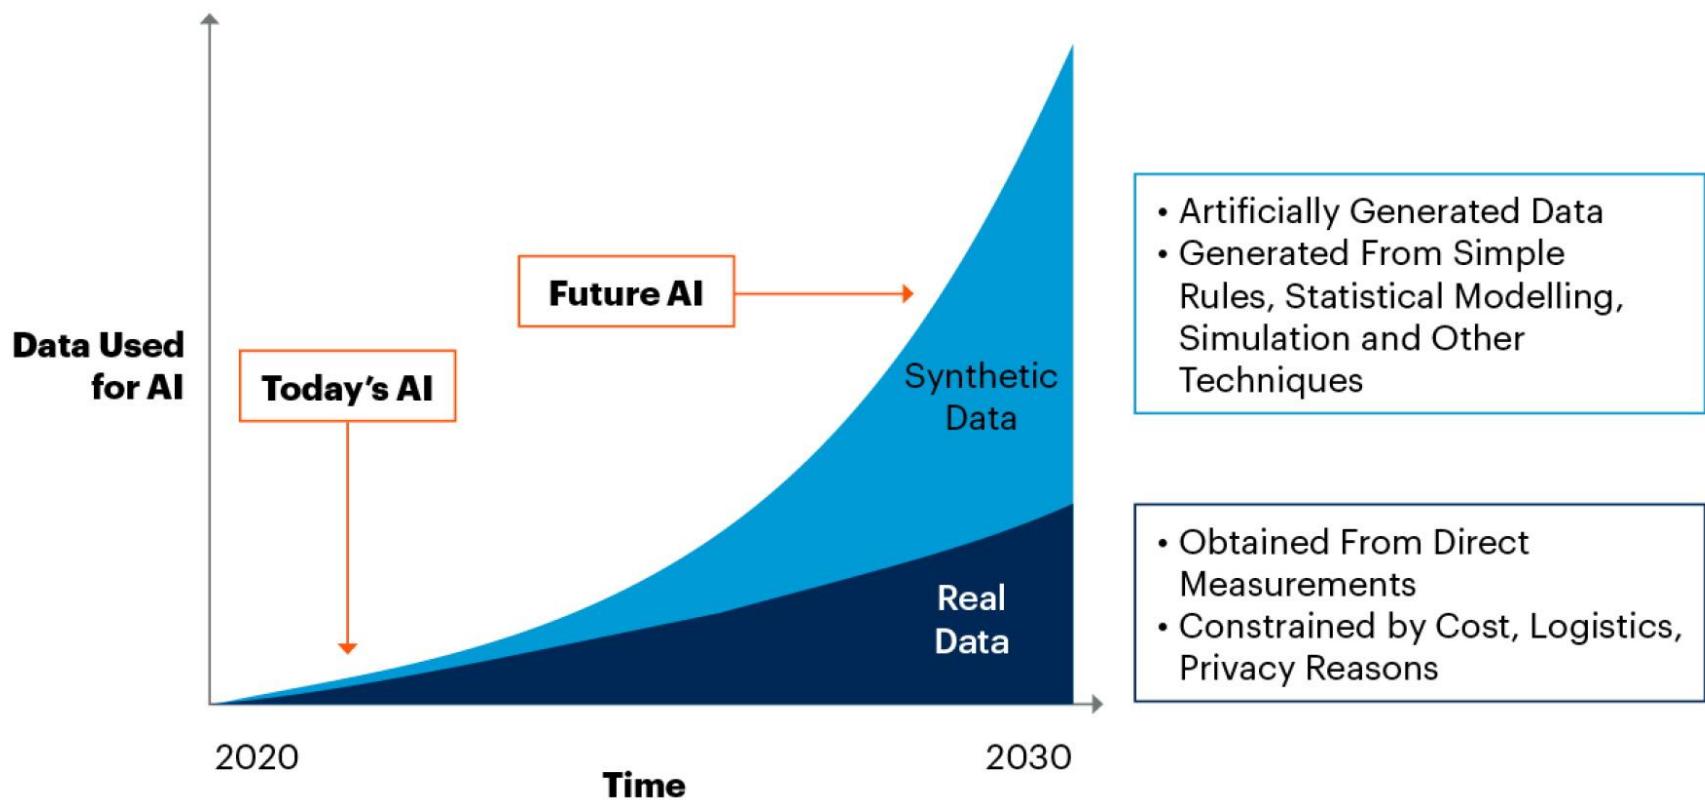

C) MRI Spine

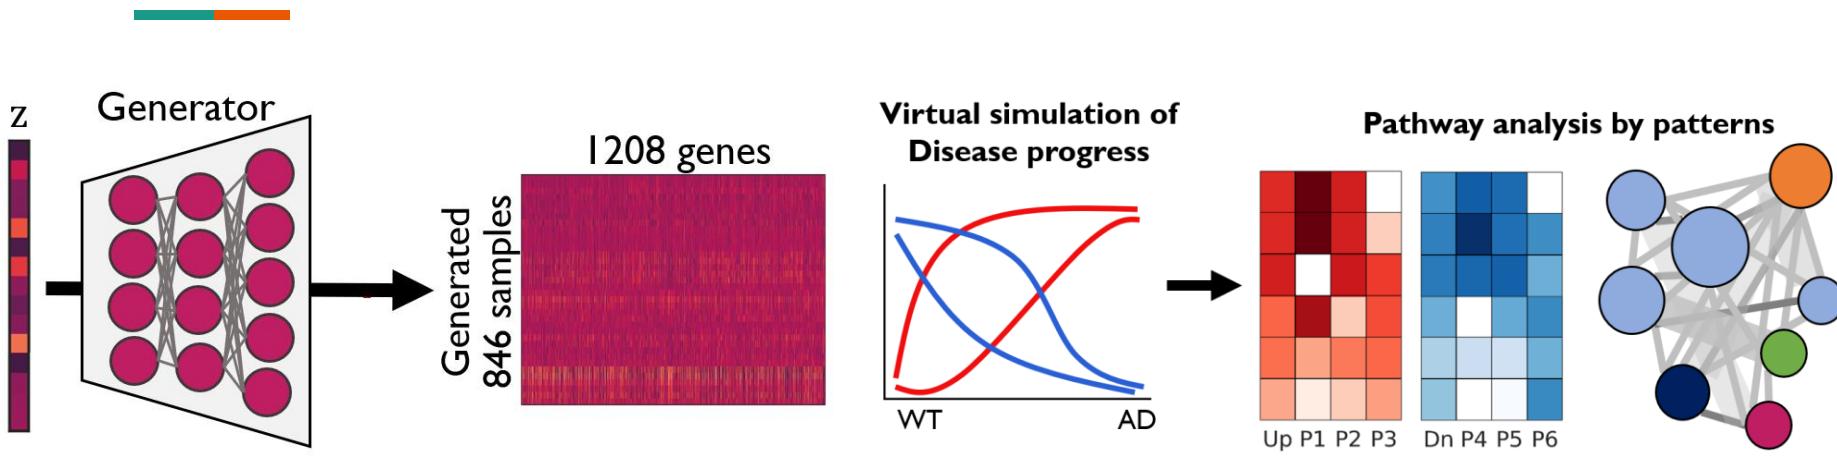

D) Colonoscopy Polyp

## By 2030, Synthetic Data Will Completely Overshadow Real Data in AI Models

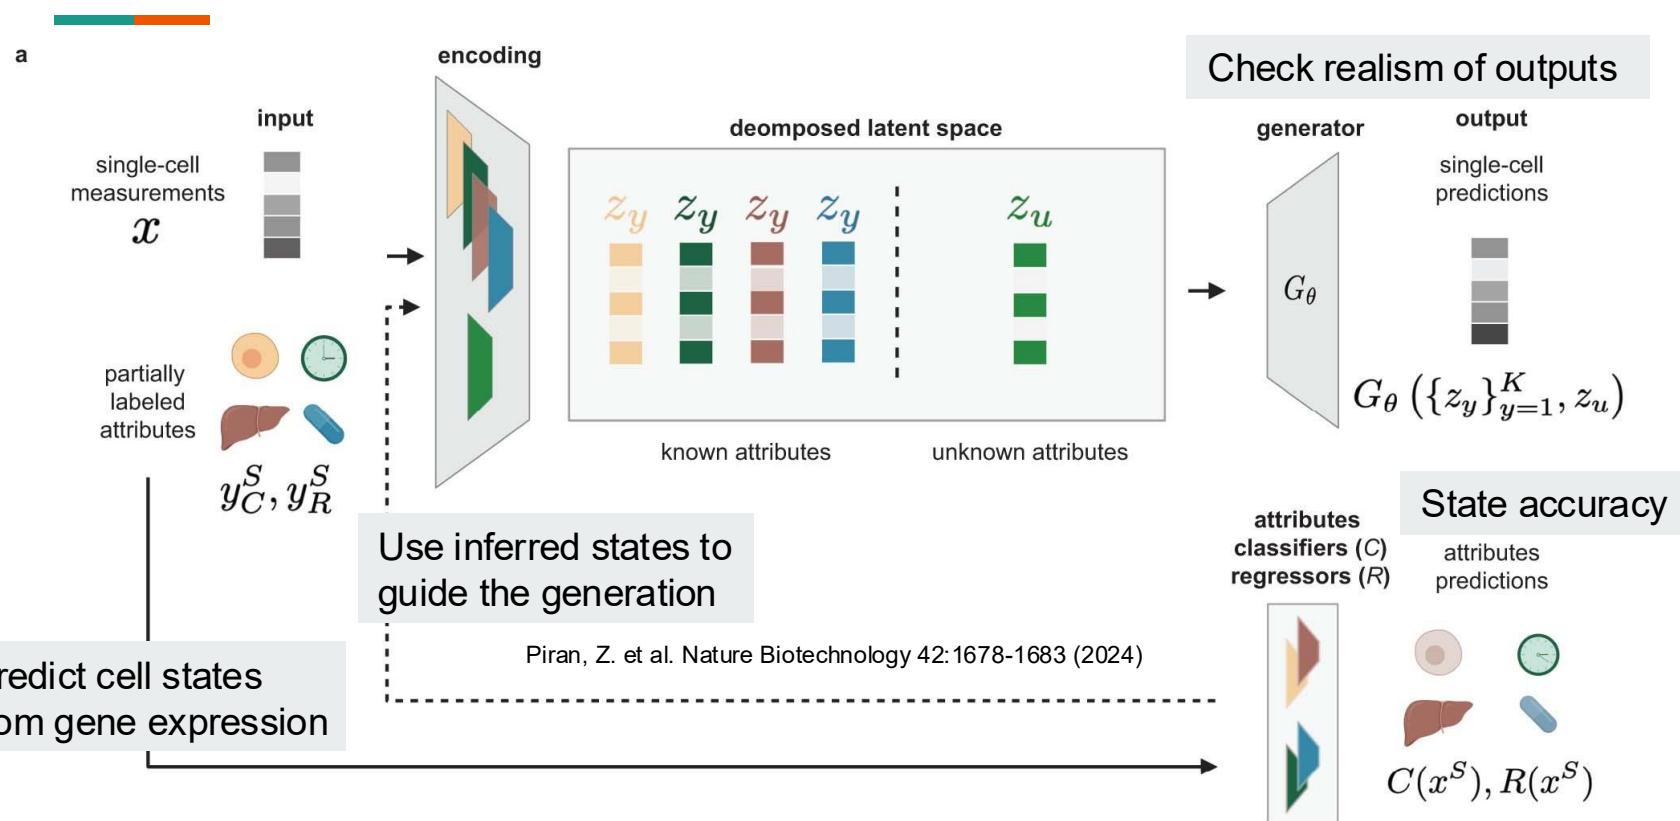

# Knowledge from synthetic data

Park, J. et al. PLoS Computational Biology 16:e1008099 (2020)

- Train a generative model with data from small-scale experiment
- Simulate time-course transcriptomics data
- Analyze simulated data to gain insights into disease progression
- Validate biomarkers in external datasets

# Disentangle factors influencing gene expression

# Summary

---

- Early AI were driven by human knowledge and fixed rules
- The emergence of digital computer and internet enabled data-driven, machine learning approach to AI
- New hardware and training techniques gave rise to the ability of AI to learn representations by themselves
- Learning through generation allows modern AI to mimic complex mechanisms behind the data and disentangle important factors

# Any question?

---

- See you next time
